1 PROBLEM

Let \mathbf{A} be an $m \times n$ matrix with entries in F and let T be the linear transformation from $F^{n \times 1}$ into $F^{m \times 1}$ defined by $T(\mathbf{X}) = \mathbf{AX}$. Show that if $m < n$ it may happen that T is onto without being non-singular. Similarly, show that if $m > n$ we may have T non-singular but not onto.

2 SOLUTION

A linear transformation is called *singular* if it has non-zero nullity, that is it's nullspace contains atleast one non-zero vector, otherwise it is called *non-singular*.

1) if $m < n$

$$\implies \dim \text{Col}(\mathbf{A}) < n \quad (2.0.1)$$

Hence $T(\mathbf{X})$ can be onto.

From Rank-Nullity Theorem,

$$\dim \text{Col}(\mathbf{A}) + \dim \text{Null}(\mathbf{A}) = n \quad (2.0.2)$$

From (??) and (??)

$$\dim \text{Null}(\mathbf{A}) \neq 0 \quad (2.0.3)$$

$\therefore T(\mathbf{X})$ is not a non-singular transformation.

Hence if $m < n$ it may happen that T is onto without being non-singular.

2) if $m > n$

$$\implies \dim \text{col}(\mathbf{A}) > n \quad (2.0.4)$$

Assume \mathbf{A} is not singular.

$$\text{If } T(\mathbf{X}) = \mathbf{0} \quad (2.0.5)$$

$$\mathbf{AX} = \mathbf{0} \quad (2.0.6)$$

$$\implies \mathbf{X} = \mathbf{0} \quad (2.0.7)$$

Hence $T(\mathbf{X})$ may be a non-singular.

$$\implies \dim \text{Null}(\mathbf{A}) = 0 \quad (2.0.8)$$

But Rank-Nullity Theorem is not satisfied,

$$\therefore \dim \text{Col}(\mathbf{A}) + \dim \text{Null}(\mathbf{A}) \neq n \quad (2.0.9)$$

From (??), we can say $T(\mathbf{X})$ do not span $F_{m \times 1}$ and $T(\mathbf{X})$ is not onto.

Hence if $m > n$ it may have that T is non-singular but not onto.
