1 Problem

Let $\mathbf{A}$ be an $m \times n$ matrix with entries in F and let T be the linear transformation from $F^{n\times 1}$ into $F^{m\times l}$ defined by $T(\mathbf{X}) = \mathbf{AX}$. Show that

1) if $m < n$ it may happen that T is onto without being non-singular
2) if $m > n$ we may have T non-singular but not onto.

2 Definitions

A linear transformation $T(\mathbf{X}) : \mathbb{R}^n \to \mathbb{R}^m$ is said to be	
singular	if $\exists$ some $\mathbf{X} \in \mathbb{R}^m$ s.t $T(\mathbf{X}) = \mathbf{0}$ and $\mathbf{X} \neq \mathbf{0}$ i.e $Nullity(T) \neq 0$
non-singular	if $\exists$ some $\mathbf{X} \in \mathbb{R}^m$ s.t $T(\mathbf{X}) = \mathbf{0} \implies \mathbf{X} = \mathbf{0}$ i.e $Nullity(T) = 0$
onto	if for every $\mathbf{b} \in \mathbb{R}^m$, $T(\mathbf{X}) = \mathbf{b}$ has atleast one solution $\mathbf{X} \in \mathbb{R}^n$ i.e *Rank(T)* $= m$ & *Rank(T)* $\leq n$

3 Solution

<table>
<tr><td colspan="3">Let $\mathbf{A}$ be an $m \times n$ matrix with entries in F and
let T be the linear transformation from $F^{n\times 1}$ into $F^{m\times l}$
defined by $T(\mathbf{X}) = \mathbf{AX}$. If,</td></tr>
<tr><td></td><td>$m < n$</td><td>$m > n$</td></tr>
<tr><td>singular</td><td>$\implies rank(\mathbf{A}) < n$
From Rank-Nullity Theorem,
$Rank(\mathbf{A}) + Nullity(\mathbf{A}) = n$
$\implies Nullity(\mathbf{A}) \neq 0$
$\therefore T(\mathbf{X})$ is a singular.</td><td>$\implies rank(\mathbf{A}) > n$
If $T(\mathbf{X}) = \mathbf{0}, \mathbf{AX} = \mathbf{0}$
$\implies \mathbf{X} = \mathbf{0}$
Hence T(X) is non-singular.
$\implies Nullity(\mathbf{A}) = 0$</td></tr>
<tr><td>onto</td><td>$\implies rank(\mathbf{A}) < n$
Hence $T(\mathbf{X})$ can be onto.</td><td>$Rank(\mathbf{A}) + Nullity(\mathbf{A}) > n.$
Rank-Nullity Theorem is,
$T(\mathbf{X})$ do not span $F^{m\times 1}$.
$\therefore T$ is not onto.</td></tr>
</table>
